

4. How many amino acids are involved in the reaction to make a dipeptide?
5. In Model 1 the original amino acids are combined through a **condensation reaction** to make the dipeptide.
- What does  $R_1$  represent in the dipeptide?
  - What does  $R_2$  represent in the dipeptide?
6. Put a box around the atoms in the amino acids that become the  $H_2O$  molecule produced by the reaction in Model 1.
7. A peptide bond is a covalent bond linking two amino acids together in a peptide.
- Circle the peptide bond in Model 1.
  - Between which two atoms in the dipeptide is the peptide bond located?
  - Between what two functional groups is the peptide bond located?
8. There are 22 different amino acids found in nature. Two were shown in Model 1. Additional examples are shown below. With your group, write one or two grammatically correct sentences to describe how these amino acids are similar and how they are different. Use the terms R-group, amine group, and carboxyl group in your description.

Glycine  
(Gly)

Cysteine  
(Cys)

Asparagine  
(Asn)

Phenylalanine  
(Phe)

## Model 2 – Protein Structure (Part A)

### Primary Structure

Amino acid sequence: Ser – Tyr – Ala – Phe – Val – Cys – Tyr – Asp – Cys – Gly

Peptide structure:

### Secondary Structure

9. Locate the **primary structure** of the polypeptide in Model 2.
- Draw an arrow to two different peptide bonds in the diagram.
  - Circle three separate amino acids that were joined together to make the polypeptide.

10. The first five amino acids in this **polypeptide** are serine, tyrosine, alanine, phenylalanine, and valine, in that order (Ser-Tyr-Ala-Phe-Val). If the amino acids were changed or rearranged (i.e., to Val-Phe-Ala-Ser-Tyr), the polypeptide would have a different name and identity. With your group, use this information to write a definition of the primary structure of a protein.
11. Locate the **secondary protein structure** in Model 2.
- What types of bonds are holding the secondary structure in place?
  - What groups on the amino acids are always involved in these bonds?
12. Draw a rectangle around two different R groups on the amino acids in the secondary structure in Model 2.
13. Is there any interaction between R groups in the secondary structure in Model 2?
14. Secondary protein structure can take the form of an alpha( $\alpha$ )-helix or a beta( $\beta$ )-pleated sheet, as illustrated below.
- Which drawing represents an  $\alpha$ -helix, Molecule 1 or Molecule 2? Explain your reasoning.
  - Which drawing represents a  $\beta$ -pleated sheet? Explain your reasoning.

-  15. With your group, write a grammatically correct sentence that summarizes how the secondary protein structure is formed from the primary structure.

## Model 3 – Protein Structure (Part B)

### Tertiary Structure

### Quaternary Structure

21. With your group, using grammatically correct sentences, define the following.

- a. Tertiary protein structure.
  
  
  
  
  
  
  
  
  
  
- b. Quaternary protein structure.

22. Imagine a protein chain that includes the following amino acids among several others.

Serine

Cysteine

Asparagine

Phenylalanine

- a. Which of the amino acids could form a hydrogen bond with another amino acid in the chain to stabilize the secondary structure of a  $\beta$ -pleated sheet?
  
  
  
  
  
  
  
  
  
  
- b. Which of the amino acids could form disulfide bonds with another amino acid in the chain to stabilize the tertiary structure of the protein?
  
  
  
  
  
  
  
  
  
  
- c. Which of the amino acids could participate in hydrophobic interactions with another amino acid in the chain to stabilize the tertiary structure of the protein?
  
  
  
  
  
  
  
  
  
  
- d. What types of bonds or interactions could asparagine form with another amino acid in the chain in order to form a quaternary structure with another protein chain?

23. Fill in the following chart using what you've learned from Models 1–3.

Structure	Bond(s) or interactions holding the structure together	Short description	Number of polypeptide chains involved
Primary			1
Secondary			1
Tertiary			1
Quaternary			2 or more

## Read This!

---

Heating and changing pH levels are two ways to disrupt the shape of a protein. High temperatures or pH levels that vary from the natural environment of the protein will break hydrogen bonds, ionic bonds, disulfide bridges, and hydrophobic interactions. Covalent bonds will usually remain undisturbed. This process of destroying the shape of a protein is called **denaturing**.

---

24. Which of the four levels of protein structure is maintained after denaturing? Explain your answer.

## Extension Questions

27. If a mutation in the DNA of an organism results in the replacement of an amino acid containing a polar R-group with another amino acid containing a nonpolar R-group, how might the structure of the protein be affected? Address the impact on all levels of the protein structure in your answer.
28. Egg whites are primarily composed of the protein albumin. One familiar example of the denaturing of proteins is the difference between the albumin structure in a raw egg versus a cooked egg. Using what you know about the levels of structure in proteins, propose an explanation of changes in albumin (and other proteins) that occur during cooking.
29. Predict what would happen to the egg white if a raw egg were placed in vinegar. Explain your thinking.
